XpressStor Online Backup Service

Powerful Local and Offsite Electronic Backup
for Peace-of-Mind Disaster Recovery

XpressStor is a managed, secure, reliable and affordable data backup solution. Each XpressStor server provides easy access to local data backup for quick restorations. Offsite replication to the Xpress Host data center provides a complete disaster recovery solution.

“Implementing XpressStor is easy,” says Scott Lewis, CEO of Winning Technologies, the parent company of Xpress Host. “A software agent is installed on each computer workstation and server to be protected. After the initial configuration, backups occur automatically. XpressStor remotely monitors and manages the backup process without ever accessing customer data.”

USER-DEFINED RETENTION POLICIES

Setting retention policies allows contractors to manage and control backup storage needs while protecting mission critical data. “Each file that is backed up could have several revisions stored on the Xpress-Host servers,” explains Lewis. “Each revision represents a different version of the backed up files over time. Retention policy gives customers the ability to specify how long they want to keep all revisions of their files, and how long after that they would like to keep daily, weekly, monthly, and yearly historic revisions of files.”

Administrators can define different policies for varying sections of data to create a custom data retention policy for their company’s specific needs.

STAGED BACKUP SOLUTIONS

Staged backup solutions are also available through Xpress Host. Companies first backup their data to a local server which then replicates to an XpressStor remote server.

In the event of a disaster, Business Continuation Programs provide the necessary servers and infrastructure to quickly get customers back online. “If a business affecting event occurs, XpressStor can quickly bring a customer back online within hours in our virtual server farm,” says Lewis. “This eliminates the expenses of maintaining hardware in offsite locations and additional software licensing. Your data and infrastructure are secure, with a single vendor to deal with in the event of a disaster.”

RACK MOUNT AND DESKTOP CONFIGURATIONS

XpressStor controllers are available in both rack mount and desktop configurations. XpressStor servers range in sizes from 50GB to 12TB capacity for backup storage. Each XpressStor server requires an offsite cloud storage subscription. Size is determined based on retention policies, periods and volume of data being stored under your subscription. Subscriptions start as low as \$99 per month.

XPRESS HOST ADVANTAGES

- Managed and monitored
- Specialist reviews backup logs daily
- Server health monitoring
- Reduced administration time and costs
- Full reporting emailed daily and viewable online
- Supports Windows, Linux and Mac
- Message level Exchange backup
- SQL and MySQL backup
- User-friendly web-based interface
- 448-bit encryption ensures data security

SUPPORT

- 24x7x365 help desk technical support
- Preloaded disaster replacement units
- Replacement units shipped same day
- Installation and backup configuration assistance
- Data archiving services available for long-term storage
- 60-day evaluation units
- Software workstation backups
- Pricing as low as 25 cents per GB
- Upgrade assurance programs
- Business continuation programs

Replication time for the initial upload to the Xpress Host data center may vary based on customer bandwidth. Visit www.xpresshost.net for more information.
